Mechanical Design Challenge

Research Document

1. List some simple machines that you think will be involved in your design, and how they will contribute to achieving the desired outcome.

2. What are some other elements involved in a machine that can lift heavy loads? Which of these features do you think you will implement in your design and how?

3. What are some of the challenges involved in designing a machine that can lift heavy loads? How do you plan to overcome these challenges in your own design?

5. How might some of the materials provided work in your design? How might you use some of the materials to replicate larger machines on a smaller scale?

6. Provide examples of some existing machines that meet the challenge criteria, and explain how you might use these as inspiration for your own design.

5. In the space below, include at least 5 images of machines or features for inspiration.
